1.0 INTRODUCTION

The Douglas Aircraft Company (DAC) C-6 Facility is located at 19503 South Normandie Avenue, Torrance, California (Figure 1). Quarterly groundwater sampling is being conducted in response to the California Regional Water Quality Control Board - Los Angeles Region correspondence addressed to DAC and dated 7 April 1992. This report summarizes laboratory analytical data generated through the chemical analysis of groundwater samples collected during the period of 21-23 September 1992.

2.0 QUARTERLY MONITORING PROGRAM

Third Quarter 1992 groundwater sampling was performed in accordance with standard sampling procedures. Static water level depths were measured on 21 September 1992 prior to initiating purging of groundwater from any observation wells.

Groundwater samples were collected from the following wells and chemically analyzed for volatile organic compounds (VOCs) by EPA Method 8240:

WCC-1S, WCC-2S, WCC-3S, WCC-4S, WCC-5S, WCC-6S, WCC-7S, WCC-8S, WCC-9S, WCC-10S, WCC-11S, WCC-12S, WCC-1D, WCC-3D, and DAC-P1.

Table 1 summarizes observation well construction details. Table 2 summarizes the results of chemical analysis of groundwater samples and duplicates. Table 3 summarizes available measured groundwater elevations to date. Copies of laboratory data sheets, groundwater purge and sample forms, and Chain-of-Custody records are included in Appendices A, B, and C, respectively.

2.1 Groundwater Sampling Procedures

Prior to collecting groundwater samples from each well, groundwater was purged by using an electrical submersible pump that was temporarily installed into the observation well. After lowering the pump to the approximate mid-point of the saturated well screen, approximately three to five wetted casing volumes of groundwater were purged from the well until the following groundwater monitoring parameters had stabilized to within 10% of preceding readings: pH, electrical conductivity, temperature and clarity. Purged groundwater was stored onsite in DOT approved 55 gallon barrels pending the results of laboratory analysis of samples.

Following groundwater purging, the submersible pump was removed from the well and a representative groundwater sample was collected using a steam-cleaned stainless steel point-source bailer equipped with top and bottom ball-check valves. The bailer was lowered to the approximate mid-point of the saturated well screen interval and retrieved to ground surface. The contents of the bailer were discharged into four labelled 40-ml capacity vials preserved with HCl.

One blind duplicate groundwater sample was collected each day from selected observation wells for Quality Control purposes. Duplicates were collected in four HCl-preserved vials and identified by inserting the collection date after "DW-". For example, a duplicate sample collected on 21 September 1992 was identified as "DW-061692". No further sample identification was provided to the laboratory.

2.2 Field QA/QC Procedures

To verify that the groundwater samples were not exposed to analytes during storage and transportation to the analytical laboratory and that decontamination of sampling equipment was satisfactory to prevent cross-contamination of groundwater samples, trip blanks and field (equipment) blanks were chemically analyzed for VOCs. One trip blank was placed in the ice-cooled storage/transportation chest when the first groundwater sample was collected, and transported to the laboratory with the day's samples. Trip blanks were identified following a similar protocol to that used for duplicate water samples. For example, a trip blank prepared on 21 September 1992 was identified as "TB-092192".

Following decontamination of the bailer by steam-cleaning, and prior to collection of groundwater samples from successive wells, a field blank was prepared for laboratory analysis. Each field blank was prepared by pouring Reagent Grade II (Milli-Que) water, prepared by the analytical laboratory, through the bailer and discharge spigot and collecting the rinsate in one 40-ml vial preserved with HCl. Field blanks were identified following a similar protocol to that used for duplicate water samples. For example, a field blank prepared on 21 September 1992 was identified as "FB-092192". The well sampled following field blank preparation was recorded.

All groundwater, duplicate, trip blank and field blank samples were transported in ice-cooled chests to West Coast Analytical Services, Inc. Santa Fe Springs, California using U.S. EPA-recommended Chain-of-Custody procedures.

3.0 EVALUATION OF ANALYTICAL RESULTS

3.1 Groundwater Gradient

Groundwater levels were measured prior to sampling on 21 September 1992 (Table 3 and Appendix B). An estimated potentiometric surface map for the shallow zone is presented as Figure 4. The groundwater gradient in the shallow zone was generally south-southeast with a southerly trough-like depression in the vicinity of observation wells WCC-7S and WCC-12S based on September 1992 measurements. Prior reports prepared by Woodward-Clyde Consultants (WCC, Phase II Report, May 1988; Phase III Report, March 1990) have indicated a generally southeast gradient direction, which is similar to current estimated conditions. Insufficient data (two wells) are available to define the groundwater gradient in the deeper zone.

3.2 Analytical Data

The results of chemical analysis of groundwater and duplicate samples are summarized on Table 2. Duplicate groundwater samples are indicated by an asterisk and are presented with the "original" groundwater sample. This table includes cumulative analytical data for all monitoring wells and includes detection limits (where available) for the listed chemicals.

The following observations are noted:

- Data for groundwater samples collected from well DAC-P1, located at the upgradient Property boundary, indicate that TCE concentrations have increased from 21,000 micrograms per liter (ug/L) to 28,000 ug/L coming onto DAC's property.
- Background concentrations of TCE in the shallow zone upgradient wells, WCC-10S, WCC-2S and WCC-11S, have generally increased to 120 ug/L, 100 ug/L and 120 ug/l, respectively. In addition, numerous additional chemicals were detected in groundwater samples for the first time, and at relatively low concentrations (1-96 ug/L). These compounds are denoted by a double asterisk in Table 2.
- TCE and other VOC concentrations (Table 2), in samples collected from shallow zone downgradient wells WCC-5S and WCC-9S, and WCC-12S, in conjunction with groundwater elevation data, indicate that the groundwater gradient and attendant chemical transport is in a generally southerly direction in the vicinity of Building 36 (Figures 3 and 4). The data do not suggest chemical migration offsite.
- TCE and other VOC concentrations (Table 2), in samples collected from the two deeper zone wells (WCC-1D and WCC-3D), indicate a decrease in concentrations from previous sampling round.
- Low concentrations of Tetrahydrofuran and Freon-TF were detected in two field blanks (FB-092192) and FB-092292) at low concentrations (1-6 ug/L). Tetrahydrofuran was also detected in one lab blank (09239, 10 ug/L). Methylene Chloride was detected in all samples including field and laboratory blanks. Tetrahydrofuran, Freon-TF and Methylene Chloride are most likely laboratory contaminants.

Abbreviations Summary

General Reporting Abbreviations:

- B Blank - Indicates that the compound was found in both the sample and the blank. The sample value is reported without blank subtraction. If the sample value is less than 10X the blank value times the sample dilution factor, the compound may be present as a laboratory contaminant.
- D Indicates that the sample was diluted, and consequently the surrogates were too dilute to accurately measure.
- DL Detection Limit - Is the minimum value which we believe can be detected in the sample with a high degree of confidence, taking into account dilution factors and interferences. The reported detection limits are equal to or greater than Method Detection Limits (MDL) to allow for day to day and instrument to instrument variations in sensitivity.
- J Indicates that the value is an estimate.
- ND Not Detected - Indicates that the compound was not found in the sample at or above the detection limit.
- ppm parts per million (billion) in liquids is usually equivalent to mg/l (ug/l), or in solids to mg/kg (ug/kg). In the gas phase it is equivalent to ul/l (ul/m³).
- ppb
- TR Trace - Indicates that the compound was observed at a value less than our normal reported Detection Limit (DL), but we feel its presence may be important to you. These values are subject to large errors and low degrees of confidence.

kg kilogram	mg milligram	l liter	m meter
g gram	ug microgram	ul microliter	

QC Abbreviations:

- Control Control Limits are determined from historical data for a QC parameter. The test value must be within this acceptable range for the test to be considered in control. Usually this range corresponds to the 99% confidence interval for the historical data.
- % Error Percent Error - This is a measure of accuracy based on the analysis of a Laboratory Control Standard (LCS). An LCS is a reference sample of known value such as an NIST Standard Reference Material (SRM). The % Error is expressed in percent as the difference between the known value and the experimental value, divided by the known value. The LCS may simply be a solution based standard which confirms calibration (ICV or CCV - initial or continuing calibration verification), or it may be a reference sample taken through preparation and analysis.
